

HyO H2i water systems are a nature-positive way to improve floral distribution outcomes

HyO hydrogen-rich irrigation (H2i) systems help floral distributors naturally keep flowers fresher for longer. By upgrading the quality of your water, HyO helps improve hydration, reduce losses, and give your customers better-looking blooms that last.

Cleaner Water = Healthier Flowers

HyO systems help keep your water cleaner, reducing bacteria that can clog stems and block hydration. H2i gives your flowers better water uptake, stronger stems, and longer-lasting freshness. When flowers hydrate properly, everything works better.

More Flexibility in Your Operation

H2i extends the “working window” for florists (arrangements can be made days earlier). Shippers and wholesalers can decrease waste by up to 45% by maintaining flower freshness for a longer period during transit.

Flowers Customers Prefer

Distributors using HyO consistently report faster hydration and visibly fresher blooms. H2i gives flowers brighter colors, stronger, firmer petals, and better shelf appeal. Retail buyers observe a positive difference.

Longer shelf life

Independent research shows H2i helps slow the natural aging process in flowers. H2i slows wilting, reduces browning, keeps blooms vibrant up to five extra days or more (depending on the variety). More days of freshness means more selling time and less throwaway products.

Hydrangeas watered with HyO (left) and control (right) after 9 days.

Control flowers (left) and HyO-watered flowers (right) after 16 days; note the flower quality and the clarity of the vase water on the HyO side.

A Simple Upgrade That Pays for Itself

HyO H2i systems are easy to integrate into your current operation. No complicated processes, just better water delivering better results.
